

A 35-year-old man visited a doctor with complaints of severe pain in the right eye, photophobia, lacrimation, and blurred vision. The complaints appeared after working with a welding machine\*. He does not use contact lenses. On examination: the eye gap was narrowed, moderate pericorneal injection, visual acuity was good. After instillation of the anesthetic solution, the condition of the patient improved, which made it possible to conduct a slit lamp examination and detect a corneal defect 3 mm in size, which was colored with fluorescein\*. What treatment would be most effective?
