

Test 14

- The patient complains of headache, difficulty in nasal breathing, and purulent nasal discharge for 3 months. Four months ago, they underwent treatment for the upper right premolar. Radiographic findings show opacification of the right maxillary sinus. During a diagnostic puncture of the maxillary sinus, a large amount of thick, crumbly pus with a foul odor was obtained. What is the most likely diagnosis?
- Topic 6. Acute and chronic paranasal sinuses diseases. Rhinogenous orbital and intracranial complications.

Test 14
