

Test 12

The patient complains of a severe sore throat on the left side, difficulty swallowing and opening the mouth, fever, and general malaise. From the anamnesis it is known that she has been suffering from acute pharyngitis for 4 days. Objectively observed: trismus of the masticatory muscles, left tonsil displaced to the midline, anterior palatal ridge infiltrated and protruding. The regional lymph nodes on the left are enlarged and tender to palpation. What is the most likely diagnosis?

- ➡ Topic 7. Acute diseases of the pharynx. Primary and secondary tonsillitis. Complications of tonsillitis, pharyngeal abscess, pharyngeal diphtheria.
